Abstract of JP2003099290

PROBLEM TO BE SOLVED: To monitor trouble and a stop of a monitored system without any misrecognition. **SOLUTION:** The object monitored system 2 sends a different alarm to a monitor server 3 when the cause of a start, a stop, and other trouble is unknown. The monitor server 3 sends a monitor message and confirms whether there is an answer message from the monitored system (31). When there is no answer message, a flag showing the operation state of the system is referred to and when the flag shows a system-actuation, a trouble occurrence message is displayed (32). Further, the monitor server 3 has an alarm kind decision means 33 which decides the kind of the alarm received from the monitored system and a flag setting means 34 which sets a start or stop flag of the system in a flag setting area when the decided alarm kind is an actuation kind or stop kind, and displays the trouble occurrence message (35) when the kind is another alarm kind and the start flag is set in the flag setting area.
